5V/3.3V 32K X 8 CMOS SRAM (Common I/O)

Features

- AS7C256 (5V version)
- AS7C3256 (3.3V version)
- Industrial and commercial temperature
- Organization: 262,144 words × 16 bits
- High speed
  - 12/15/20 ns address access time
  - 5/6/7/9 ns output enable access time
- Very low power consumption: ACTIVE
  - 660mW (AS7C256) / max @ 12 ns
  - 216mW (AS7C3256) / max @ 12 ns
- Very low power consumption: STANDBY
  - 22 mW (AS7C256) / max CMOS I/O
  - 7.2 mW (AS7C3256) / max CMOS I/O
- 2.0V data retention
- Easy memory expansion with $\overline{CE}$ and $\overline{OE}$ inputs
- TTL-compatible, three-state I/O
- 28-pin JEDEC standard packages
  - 300 mil PDIP
  - 300 mil SOJ
  - 8 × 13.4 TSOP
- ESD protection ≥ 2000 volts
- Latch-up current ≥ 200 mA

Functional description

The AS7C(3)256 is a 5V/3.3V high-performance CMOS 262,144-bit Static Random-Access Memory (SRAM) device organized as 262,144 words × 16 bits. It is designed for memory applications requiring fast data access at low voltage, including Pentium™, PowerPC™, and portable computing. Alliance's advanced circuit design and process techniques permit 3.3V operation without sacrificing performance or operating margins.

The device enters *standby mode* when $\overline{CE}$ is high. CMOS standby mode consumes ≤3.6 mW. Normal operation offers 75% power reduction after initial access, resulting in significant power savings during CPU idle, suspend, and stretch mode. Both versions of the AS7C256 offer 2.0V data retention.

Equal address access and cycle times (t_{AA}, t_{RC}, t_{WC}) of 12/15/20 ns with output enable access times (t_{OE}) of 5/6/7/9 ns are ideal for high-performance applications. The chip enable ($\overline{CE}$) input permits easy memory expansion with multiple-bank memory organizations.

A write cycle is accomplished by asserting chip enable ($\overline{CE}$) and write enable ($\overline{WE}$) LOW. Data on the input pins I/O0-I/O7 is written on the rising edge of $\overline{WE}$ (write cycle 1) or $\overline{CE}$ (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ($\overline{OE}$) or write enable ($\overline{WE}$).

A read cycle is accomplished by asserting chip enable ($\overline{CE}$) and output enable ($\overline{OE}$) LOW, with write enable ($\overline{WE}$) high. The chip drives I/O pins with the data word referenced by the input address. When chip enable or output enable is high, or write enable is low, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible and 5V tolerant. Operation is from a single 3.3±0.3V supply. The AS7C(3)256A is packaged in high volume industry standard packages.

Absolute maximum ratings

Parameter	Device	Symbol	Min	Max	Unit
Voltage on V_{CC} relative to GND	AS7C256	V_{t1}	−0.5	+7.0	V
	AS7C3256	V_{t1}	−0.5	+5.0	V
Voltage on any pin relative to GND		V_{t2}	−0.5	V_{CC} + 0.5	V
Power dissipation		P_D	–	1.0	W
Storage temperature (plastic)		T_{stg}	−65	+150	°C
Ambient temperature with V_{CC} applied		T_{bias}	−55	+125	°C
DC current into outputs (low)		I_{OUT}	–	20	mA

Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes

1 During V_{CC} power-up, a pull-up resistor to V_{CC} on $\overline{CE}$ is required to meet I_{SB} specification.
2 This parameter is sampled, but not 100% tested.
3 For test conditions, see *AC Test Conditions*, Figures A, B, C.
4 These parameters are specified with CL = 5pF, as in Figures B or C. Transition is measured ±500mV from steady-state voltage.
5 This parameter is guaranteed, but not tested.
6 $\overline{WE}$ is High for read cycle.
7 $\overline{CE}$ and $\overline{OE}$ are Low for read cycle.
8 Address valid prior to or coincident with $\overline{CE}$ transition Low.
9 All read cycle timings are referenced from the last valid address to the first transitioning address.
10 $\overline{CE}$ or $\overline{WE}$ must be High during address transitions. Either $\overline{CE}$ or $\overline{WE}$ asserting high terminates a write cycle.
11 All write cycle timings are referenced from the last valid address to the first transitioning address.
12 $\overline{CE1}$ and CE2 have identical timing.
13 2V data retention applies to the commercial operating range only.
14 C=30pF, except on High Z and Low Z parameters, where C=5pF.
